

## Compulin Initial Presentation — Viva Questions & Answers

### 1. What is the main purpose of your system?

#### Answer:

“Our system, RentFlow, is a centralized B2B web application designed for equipment rental businesses. It helps rental companies manage their customers, equipment, rentals, payments, returns, damages, losses and settlements.”

---

### 2. Why did you choose a multi-company system?

#### Answer:

“Compulin provides the platform to multiple rental businesses, so the system needs to support multiple companies within one platform. Each rental company's data must remain separate from other companies' data.”

This is one of the **important requirements** in your project, so know it well.

---

### 3. What does B2B mean in your system?

#### Answer:

“B2B means Business-to-Business. In our system, Compulin provides the platform to rental companies, and those rental companies use it to manage their own customers and rental operations.”

---

## Stakeholders & Actors

### 4. What is the difference between a stakeholder and an actor?

#### Answer:

“A stakeholder is someone who has an interest in or is affected by the system, while an actor is someone who directly interacts with the system.”

---

### 5. Who are your stakeholders?

#### Answer:

“Our main stakeholder groups are Compulin, the rental companies, and their customers.”

Your project describes the business relationship as **Compulin → Rental Companies → Their Customers**.

---

## 6. Who are your actors?

**Answer:**

“We identified three direct system actors: the Compulin Administrator, the Rental Company Administrator, and the Sales/Rental Officer.”

---

## 7. Why are there only three actors?

**Answer:**

“We identified actors based on who directly interacts with the system. The three actors represent the platform-level, company-level and day-to-day operational responsibilities defined by the client.”

---

## 8. Why isn't the renter/customer an actor?

This is a **very possible question**, especially because your system manages renters.

**Answer:**

“Currently, the renter is a customer whose information and rentals are managed by the rental-company staff. They don't directly interact with the system according to our current requirements, so we treat them as a stakeholder rather than a system actor.”

Your requirements explicitly state that authorized rental-company staff register and manage renters.

---

## Stakeholder Meetings

## 9. What did you discuss during the stakeholder meeting?

**Answer:**

“We discussed the existing equipment hiring process, including how renters request equipment, how availability is handled, how equipment is issued and returned, how payments and security deposits are handled, and what problems or improvements the client expects from the new system.”

---

#### **10. How did the stakeholder meeting help you?**

**Answer:**

“It helped us understand the actual rental workflow and the client's requirements. We used the information gathered to identify the system's functional areas and divide them into four main modules.”

---

#### **11. How did you gather your requirements?**

**Answer:**

“We used the requirement information provided by the client together with information gathered during our stakeholder discussions.”

That's consistent with what you currently say in your presentation.

---

### **Scope & Requirements**

#### **12. What is the scope of your system?**

**Answer:**

“The scope is a multi-company B2B web application for equipment rental businesses. It covers company and inventory management, renter and rental management, billing and payments, and returns, damage and settlement.”

---

#### **13. Why did you divide the system into four modules?**

**Answer:**

“We divided it according to the main stages and functional areas of the rental lifecycle. This gives each member a clearly defined responsibility while keeping the modules connected.”

---

#### 14. Are the four modules independent?

**Answer:**

“No. They are separate functional modules, but they are connected through the overall rental lifecycle.”

For example:

“Module 2 creates the rental, Module 3 handles its financial transactions, and Module 4 handles its return and settlement.”

---

#### 15. How do the four modules connect?

**Answer:**

**“Module 1 manages the company and inventory, Module 2 creates and manages rentals, Module 3 handles billing and payments, and Module 4 handles returns, damage, loss and final settlement.”**

That's a very useful answer to memorize.

---

#### **YOUR MODULE — MEMBER 2**

Since you're **Member 2**, I'd especially prepare these.

#### 16. What is your module?

**Answer:**

“My module is Renter and Rental Management. It focuses on managing renter information and the creation and management of rentals.”

---

#### 17. What are your main responsibilities?

**Answer:**

“My responsibilities include renter registration and profiles, rental history, rental creation, rental items, availability validation, security deposits, equipment issue and rental extensions.”

---

**18. What does renter registration mean?****Answer:**

“It means registering the customer or business that wants to rent equipment, and maintaining their information so that rentals can be associated with the correct renter.”

---

**19. Who registers the renter?****Answer:**

“An authorized rental-company staff member, such as the Sales/Rental Officer, registers the renter through the system.”

Your FR18 explicitly says authorized rental-company staff can register a renter/customer.

---

**20. What happens when a customer wants to rent equipment?****Answer:**

“The staff member registers or selects the renter, checks equipment availability, creates the rental with the required equipment and rental period, records the security deposit, and then the equipment can be issued.”

---

**21. Why do you check availability before creating the rental?****Answer:**

“To prevent equipment that is already rented, damaged, lost or under maintenance from being assigned to another rental.”

This is directly supported by FR16–FR17.

---

**22. What happens to equipment when it is issued?****Answer:**

“The system records the equipment issue and changes the equipment status from Available to Rented.”

That's specifically FR28–FR29.

---

**23. What is the security deposit?****Answer:**

“It is an amount associated with the rental that is recorded before the equipment is issued. Later, it can be adjusted against applicable charges, with any remaining amount potentially refunded.”

---

**24. Why is the deposit part of your module and not just billing?****Answer:**

“Our module handles the deposit requirement and its status as part of creating the rental. The later adjustment, deduction and refund are handled as part of Member 4's settlement process.”

**This is an excellent distinction to know.**

---

**25. What happens if the renter wants to keep the equipment longer?****Answer:**

“The system allows authorized staff to extend the rental period when applicable, updates the expected return date, and retains the updated rental period for charge calculations.”

---

 **Member 3 / Billing****26. What happens after a rental is created?****Answer:**

“The billing module calculates rental charges based on the agreed rental rate and period, generates invoices where applicable, records payments and maintains outstanding balances.”

---

**27. Can customers make partial payments?****Answer:**

“Yes. The system supports partial payments and maintains the remaining outstanding amount.”

That's explicitly part of Member 3's responsibilities.

---

#### **Member 4 / Returns**

##### **28. What happens when equipment is returned?**

**Answer:**

“Staff process the return and record the actual return date. The equipment is then inspected, and depending on its condition it can be made available again or marked as damaged or under maintenance.”

---

##### **29. What happens if equipment is returned late?**

**Answer:**

“The system identifies the rental as overdue, calculates the applicable late-return charge according to the rental company's rules, and the charge is then included in the financial process.”

---

##### **30. What happens if equipment is damaged?**

**Answer:**

“The damage is recorded against the equipment and rental, an applicable damage charge can be recorded, and the equipment is marked as damaged or under maintenance rather than becoming immediately available.”

---

##### **31. What happens if the renter never returns the equipment?**

**Answer:**

“The rental becomes overdue, staff can record follow-up attempts, and if it remains unresolved, the equipment can be marked as lost or non-returned and an applicable lost-equipment charge can be recorded.”

This exact scenario is in your project workflow.

---

**32. Why did you include follow-up for non-returned equipment?****Answer:**

“Because the client specifically identified the problem of renters failing to return equipment and becoming unreachable. The system therefore needs to maintain the non-return status and record follow-up attempts.”

Your requirements explicitly identify this scenario.

---

 **Questions About Module Boundaries****33. Which module handles equipment availability?****Answer:**

“Member 1 manages the equipment inventory and its current availability/status, while Member 2 validates that availability when creating a rental.”

**This distinction is important.**

---

**34. Which module handles damage charges?****Answer:**

“Member 4 identifies and assesses the damage and records the applicable damage charge. Member 3 handles the billing and payment side of that charge.”

---

**35. Which module handles the deposit?****Answer:**

“Member 2 records the required security deposit as part of the rental. Member 4 handles deposit adjustment, deductions and the final refund or settlement.”

---

**36. Which module handles rental history?****Answer:**

“Member 2 maintains the renter's rental history, while Member 4 contributes the completed rental information when the rental is closed.”

Your FR20 and FR74 establish this connection.

---

### Slightly Harder Viva Questions

#### **37. Why did you choose these particular functional requirements?**

##### **Answer:**

“We derived them from the rental workflow and the information gathered from the client. Each requirement represents a specific function the system needs to support within its assigned module.”

---

#### **38. What is the most important requirement of your system?**

Don't say one random feature. A better answer:

“The overall multi-company data separation is particularly important because each rental company must only access its own customers, equipment, rentals and related data.”

The project explicitly requires company data to remain separate.

---

#### **39. What is a non-functional requirement in your project?**

##### **Answer:**

“A non-functional requirement describes how well the system should operate rather than what function it performs. For example, security requires users to authenticate and only access information belonging to their company.”

Your specification also includes performance, reliability, usability, data integrity, scalability, maintainability and availability.

---

#### **40. What happens if two rental companies have equipment with the same name?**

##### **Answer:**

“The data belongs to separate rental companies, so the system maintains each company's inventory separately. One company's equipment records should not be accessible to another company.”

---

#### **41. What happens if equipment is already rented?**

**Answer:**

“The system identifies it as unavailable and prevents it from being issued for another rental.”

---

#### **42. Why do you need both an equipment status and availability?**

**Answer:**

“The status gives the current state of the equipment, such as Available, Rented, Damaged or Lost, while availability determines whether that item can actually be assigned to a new rental.”

---

#### **★ Questions I'd REALLY memorize**

If you don't have much time before the presentation, focus on these **10**:

- 1. What is the purpose of your system?**
- 2. Who are your stakeholders?**
- 3. Who are your three actors?**
- 4. Why isn't the renter an actor?**
- 5. What did you discuss in the stakeholder meeting?**
- 6. What are the four modules?**
- 7. What is your module responsible for?**
- 8. How do the four modules connect?**
- 9. What happens when equipment isn't returned?**
- 10. How do you ensure each rental company's data stays separate?**

## ◆ Project & Client

### 1. Why did you choose this project?

“The project was proposed by Compulin to address the management needs of equipment rental businesses. We are developing a centralized system to support their rental operations.”

### 2. What problem is your system trying to solve?

“It aims to provide a centralized way to manage rental companies, customers, equipment, rentals, payments, returns, damages and related charges.”

### 3. What is the main business flow of your system?

“A rental company registers and is activated, sets up its inventory, then customers can request equipment. Staff create and manage rentals, equipment is issued, billing and payments are handled, and eventually the equipment is returned or handled as overdue, damaged or lost.”

### 4. Why is your system web-based?

“The client requires a centralized platform that can support multiple rental companies, so a web-based system allows authorized users to access the system through the platform.”

### 5. Why is it centralized?

“Compulin is providing the platform to multiple rental companies, so a centralized system allows the platform to manage those companies while keeping each company's data separate.”

## ◆ Multi-Company Questions

### 6. What does multi-company mean?

“It means multiple rental companies can use the same Compulin platform, while each company's customers, equipment, rentals and related information remain separate.”

### 7. How will you prevent Company A from seeing Company B's data?

“Users will only be authorized to access information belonging to their own rental company. This is also one of our non-functional security requirements.”

### 8. Can two rental companies have the same equipment?

“Yes. Since each company's inventory is separate, the same type of equipment can exist in different companies' inventories without their records being mixed.”

### 9. Can one renter belong to multiple rental companies?

Be careful here because your current requirements don't explicitly define this.

“That business rule hasn't been explicitly defined in our current requirements, so we would clarify it with the client before implementing it.”

**This is a good answer if they try to make you invent a rule.**

---

## ◆ Requirements Questions

### 10. What is a functional requirement?

“A functional requirement describes what the system should do, such as allowing staff to create a rental.”

### 11. What is a non-functional requirement?

“A non-functional requirement describes how the system should operate, such as security, performance, reliability or usability.”

### 12. Give an example of one of your functional requirements.

“For example, FR21 states that the system shall allow authorized staff to create a rental for a registered renter.”

### 13. How did you decide whether something should be a requirement?

“We considered the client's stated needs and the steps in the rental workflow, then identified the functions the proposed system needs to support.”

**14. What happens if the client gives you a new requirement later?**

“We would discuss and clarify it with the client, assess how it affects the existing scope and requirements, and then update our documentation if it is approved.”

**15. Can requirements change?**

“Yes. Requirements can be refined as we gather more information from the client, but any changes should be discussed and agreed upon before being incorporated.”

---

◆ **Stakeholder Meeting Questions**

**16. Why did you need a stakeholder meeting if the client already gave you a document?**

“The client's document provided the initial requirements, while the stakeholder discussion helped us understand the actual business process and clarify how those requirements apply to the rental workflow.”

**17. What was the most important thing you learned from the meeting?**

“We gained a clearer understanding of the complete rental lifecycle, particularly how equipment is requested, checked for availability, issued, returned and handled when it is late, damaged or not returned.”

**18. Did the stakeholder meeting directly give you all your functional requirements?**

“Not necessarily as individual requirement statements. We gathered information about the business process and used that information, together with the client's requirements documentation, to derive our functional requirements.”

That's a **stronger answer** than saying “yes.”

**19. What would you ask the client in another meeting?**

“We would clarify areas where business rules are not fully defined, such as exact rental-charge rules, deposit rules, late-charge calculation and the conditions for marking equipment as lost.”

---

◆ **Actors Questions**

**20. What does the Compulin Administrator do?**

“They operate at the platform level and are responsible for managing the rental companies registered on the Compulin platform.”

**21. What does the Rental Company Administrator do?**

“They operate within an individual rental company and manage areas such as the company profile, staff/users and company resources.”

**22. What does the Sales/Rental Officer do?**

“They handle the day-to-day rental operations, such as registering renters, creating rentals, issuing equipment, recording payments and processing returns.”

Your project documentation defines these three actor roles.

**23. Can the Rental Company Administrator create a rental?**

This one is slightly tricky.

“Our requirements describe rental operations as being performed by authorized rental-company staff, particularly the operational Sales/Rental Officer. The exact permissions between the administrator and officer would need to be defined through the access-control requirements.”

## ◆ Module Integration Questions

### **41. What happens between your module and Member 1's module?**

“Member 1 manages the equipment inventory and its status, while my module uses that information to validate whether equipment can be included in a rental.”

### **42. What happens between your module and Member 3?**

“My module provides the rental information, such as the rental period and agreed rate, which Member 3 uses for rental charge calculation and billing.”

### **43. What happens between your module and Member 4?**

“My module creates and maintains the rental and renter information. Member 4 then handles the return, damage, loss, settlement and closure of that rental.”

### **44. Which module is responsible for the complete rental?**

“No single module handles the entire rental lifecycle. The lifecycle is divided between the four modules, with each responsible for a specific stage.”

---

## ◆ Scenario Questions

These are **very likely** because lecturers like asking “What happens if...?”

### **45. What happens if a customer requests equipment that is already rented?**

“The availability validation should identify that the equipment is unavailable, so it cannot be assigned to the new rental.”

### **46. What happens if the customer returns equipment late?**

“The rental becomes overdue, the applicable late charge is determined, and the rental proceeds through the return and settlement process.”

### **47. What happens if the customer damages the equipment?**

“The damage is recorded during inspection, an applicable damage charge is recorded, and the equipment is marked as damaged or under maintenance.”

### **48. What happens if the customer never returns the equipment?**

“The rental becomes overdue, follow-up attempts can be recorded, and if it remains unresolved, the equipment can be marked as lost or non-returned and an applicable charge can be recorded.”

#### **49. What happens if only some equipment is returned?**

“The system supports partial returns, so the returned items can be processed while the remaining items continue to be handled under the rental.”

#### **50. When can a rental be closed?**

“Once the associated equipment has been returned or otherwise resolved and the required damage/loss assessment and financial settlement have been completed.”

---

### **◆ Scope Questions**

#### **51. What is outside your scope?**

A good answer:

“Our current scope focuses on the rental management lifecycle. We haven't defined areas such as external accounting systems, online customer self-service or automated legal recovery processes because they aren't part of the client's current requirements.”

#### **52. Why didn't you include online customer login?**

“The current requirements identify rental-company staff as the users who register renters and manage rentals. Direct customer access hasn't been specified.”

#### **53. Why didn't you include equipment purchasing?**

“The system manages rental inventory, availability and rental operations. Purchasing or procurement of new equipment isn't included in the current scope.”

---

### **◆ Questions About Your Design Decisions**

#### **54. Why do you have four modules instead of one large module?**

“The four modules represent distinct functional areas of the rental lifecycle. This makes the system easier to organize and allows each team member to have a clearly defined responsibility.”

#### **55. Are the modules equal in scope?**

“We have divided the system into four main functional areas and assigned each member a defined set of responsibilities. Although individual features differ, each member has a substantial functional component to develop.”

## **56. Why is reporting shared?**

“Reports can use information from multiple modules. For example, a financial summary may use billing information while an operational report may use rental, inventory or return information, so reporting is treated as a shared responsibility.”

## **57. Why isn't reporting its own module?**

“Because reporting uses data generated by the other functional areas rather than representing a separate stage of the rental lifecycle.”

---

## **Questions that could catch you off guard**

## **58. What happens if a requirement conflicts with another requirement?**

“We would identify the conflict, discuss it with the client and clarify which business rule should take priority before finalizing the requirement.”

## **59. What if the client changes the scope after development starts?**

“We would assess the impact of the change on the requirements, design and development, discuss it with the client and update the project documentation if the change is approved.”

## **60. How do you know your requirements are complete?**

“We compare them against the complete rental workflow and the client's stated needs, and we use stakeholder discussions to identify missing or unclear areas.”

## **61. What is the most challenging part of your system?**

For you, I'd answer:

“Managing the connections between the rental, equipment and financial processes is challenging because the modules depend on each other. For example, creating a rental affects equipment availability and provides information needed for billing.”

## **62. What happens if your module needs something from another member's module?**

“We need to agree on the interface and data that will be exchanged between the modules so that each member can develop their component independently while maintaining integration.”

---

## **5 questions I'd especially prepare for TODAY**

If the viva is quick, these are the ones I'd **really know rather than memorize word-for-word**:

**1. Why isn't the renter an actor?**

“Because according to our current requirements, the renter's information and rentals are managed by rental-company staff, and the renter doesn't directly interact with the system.”

**2. How do the four modules connect?**

“Inventory provides available equipment → Renter & Rental creates the rental → Billing handles the financial side → Return/Damage/Settlement completes the rental.”

**3. What happens if equipment isn't returned?**

“It becomes overdue, follow-up attempts are recorded, and if unresolved it can be marked lost/non-returned with the applicable charge.”

**4. How did you gather requirements?**

“We used the client's provided requirements together with stakeholder discussions about the existing equipment-hiring process.”

**5. Why is your system multi-company?**

“Because Compulin provides the platform to multiple rental businesses, and each company needs to manage its own data separately.”

And if they ask something **very specific that your documents haven't defined**, don't panic. A perfectly valid academic answer is:

**“That business rule hasn't been specified by the client yet, so we would clarify it during the next stakeholder discussion before implementing it.”**

That actually demonstrates that you understand the difference between a **confirmed requirement and an assumption**.
